

Sun Induced Fluorescence (SIF) at Tumbarumba

Linking SIF to CO₂ fluxes across scales

Will Woodgate*, Zbynek Malenovsky (UTas)

With help from Jacqui Stol, Jess Hodgson, Mark Kitchen,
Arko Lucieer, Juliane Bendig and many more

To determine the physiological meaning of SIF from the leaf to canopy scale in an Australian system.

To determine the physiological meaning of SIF from the leaf to canopy scale in an Australian system.

1. Can *leaf-level* SIF be used to track photosynthetic efficiency? 🌿
2. Does *canopy* SIF linearly track GPP fluxes across *time scales*? 🌳
3. How can SIF be used with other complementary vegetation function optical indices (e.g. NDVI, EVI, PRI etc.)? 🌿 + 🌳
4. Can SIF be used to identify early stages of stress? And the stress type? 🌿 + 🌳

Tumbarumba site location

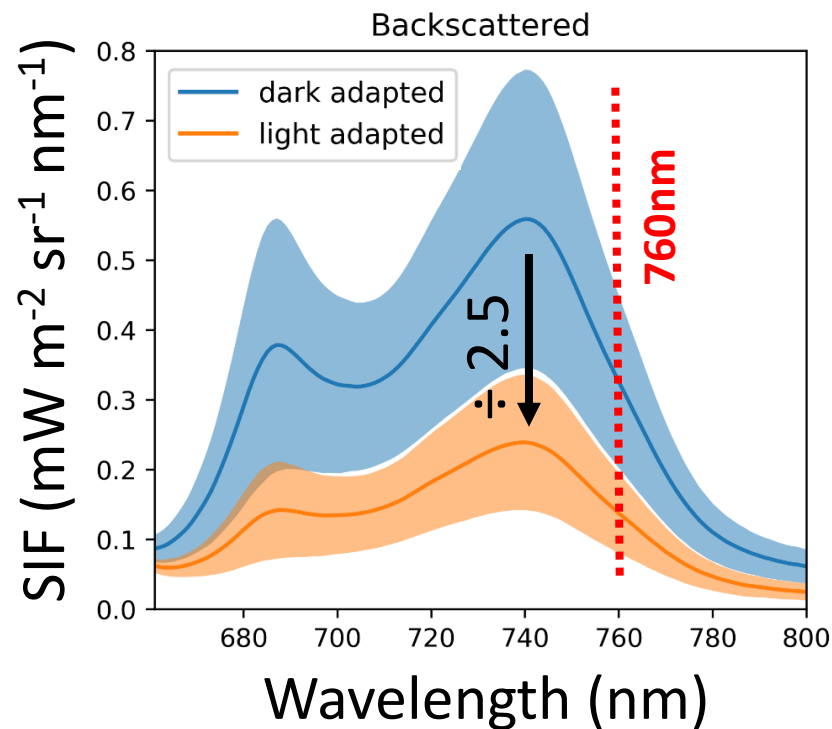

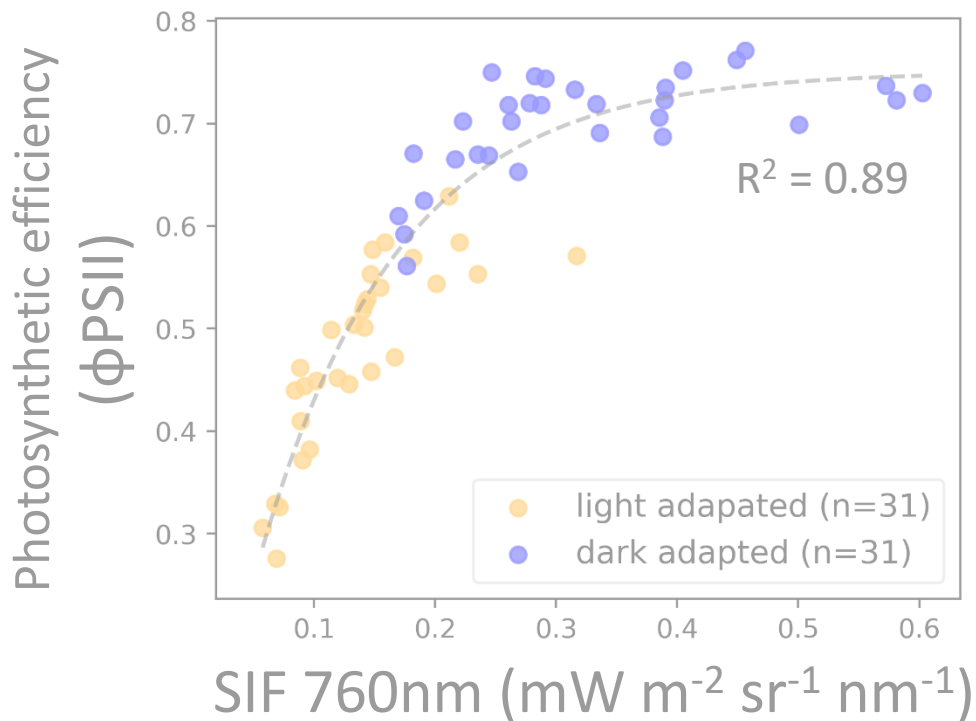

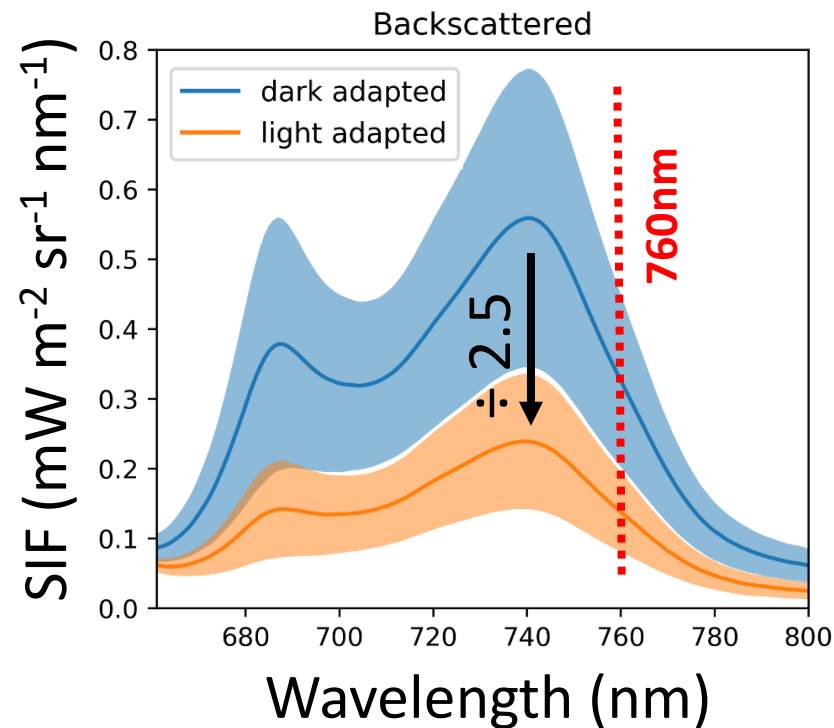

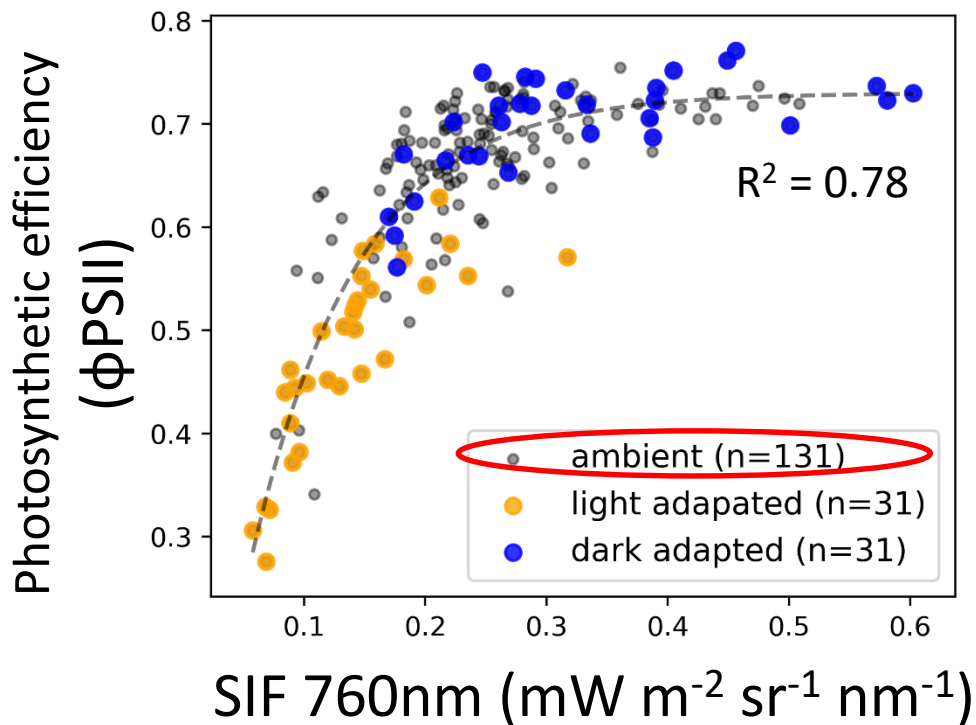

4th Sept. 2019 (bottom), 10th Sept. 2019 (top)

Fluowat leaf clip

Tower SIF at Tumba (Sept. 2019)

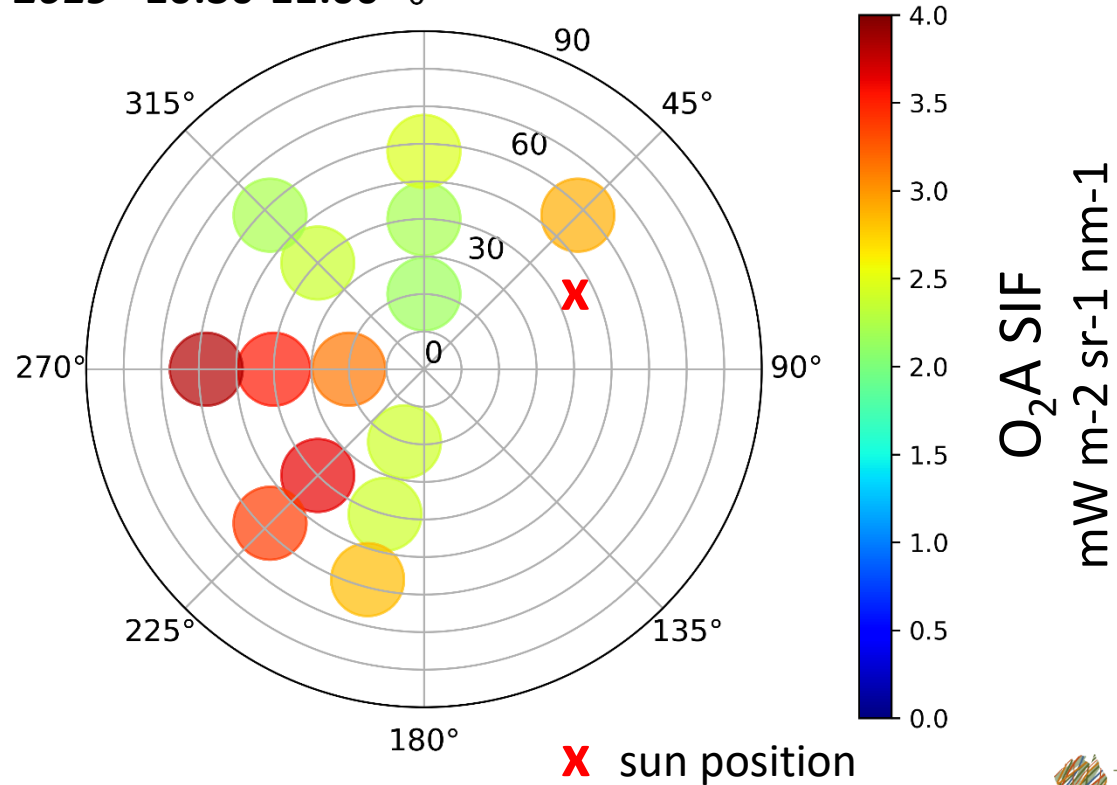

Tower image courtesy Lenny Hambrecht (UTas)

Polar plot

- 14 view angles per half hour

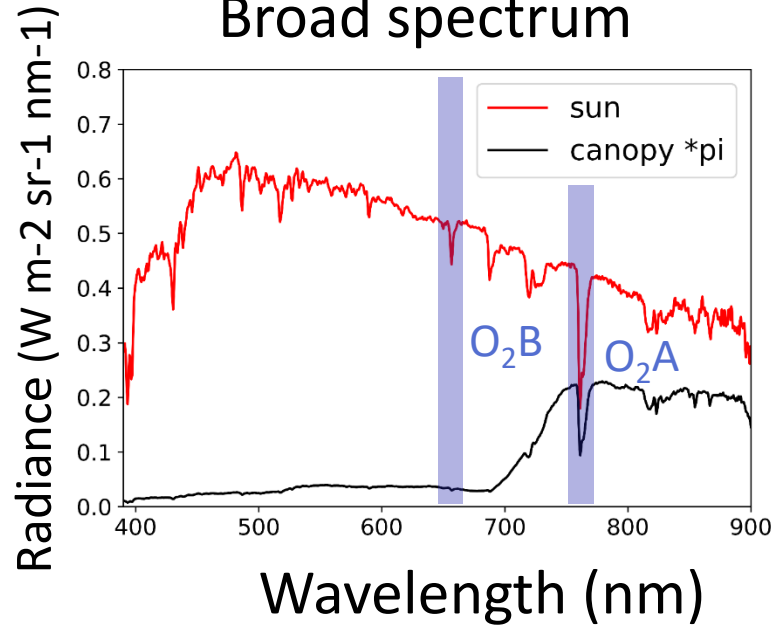

26-12-2019 10:30-11:00 0°

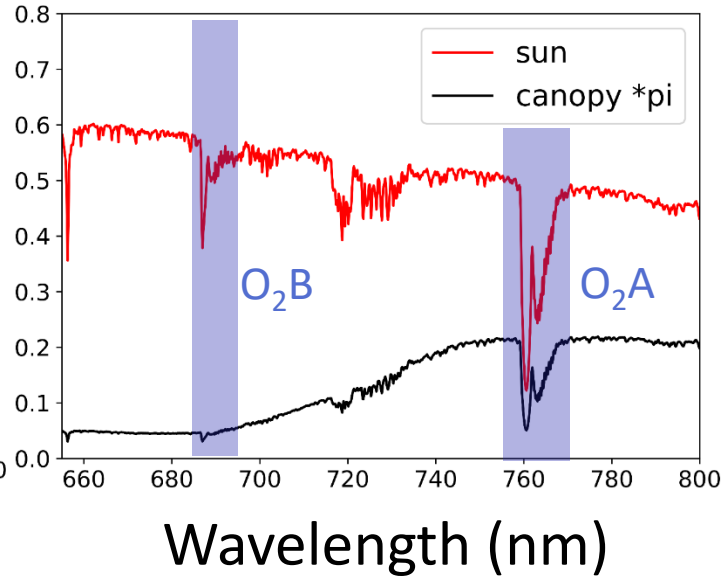

Spectrometer #1
Broad spectrum

Spectrometer #2
High spectral res

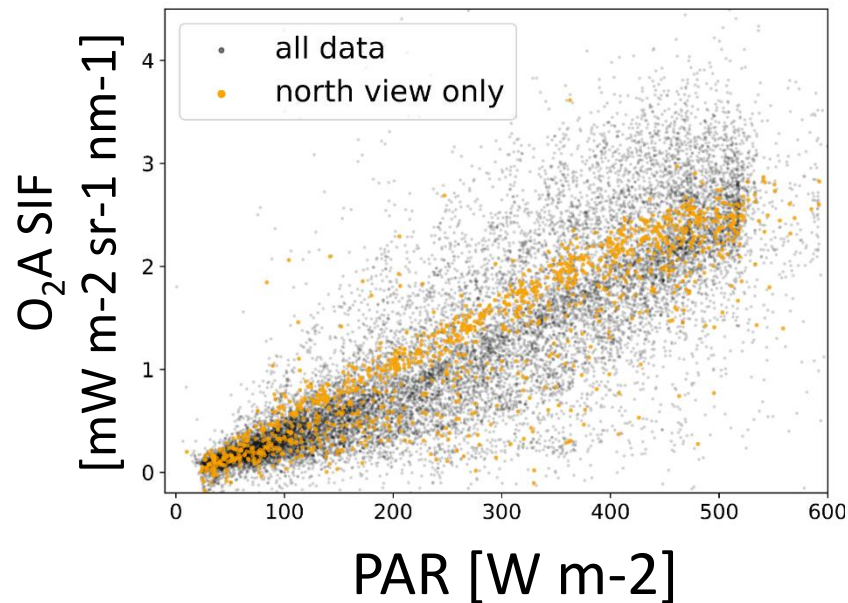

Spectra taken 26/12/2019 at midday

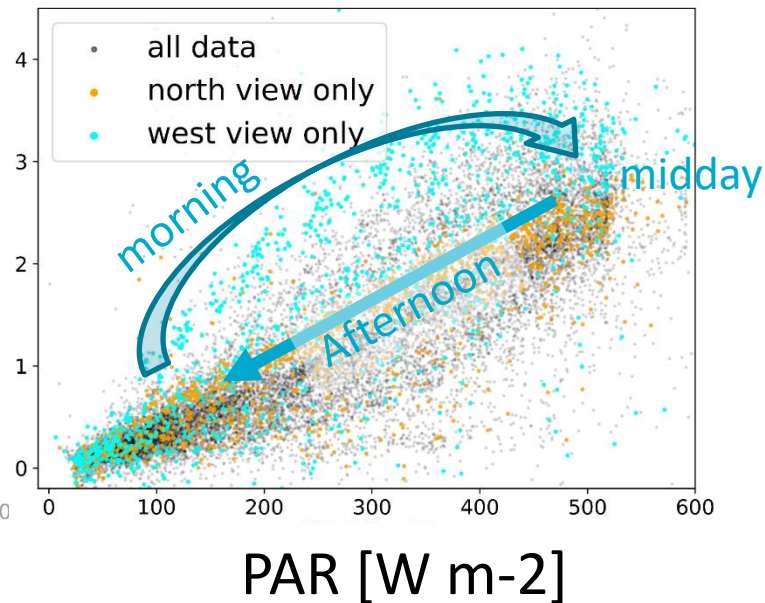

All data Oct-Dec, 2019

All data Oct-Dec, 2019

All data Oct-Dec, 2019

- More leaf-level data across seasons and stress conditions (VPD, temperature, light intensity etc.)
- Link observations with models (RTMs and biogeochemical)
- Canopy-level SIF retrieval algorithm selection/comparison
- Disturbance (fire) recovery

Thank you
