

Patterns of leaf gas exchange along a continental-scale rainfall gradient in north Australia

Lucas Cernusak
Charles Darwin University

Sampling sites

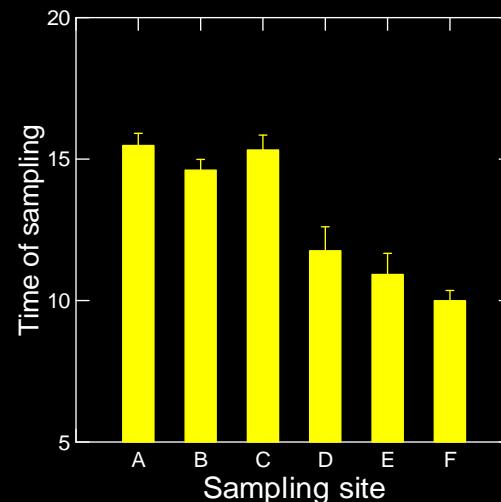

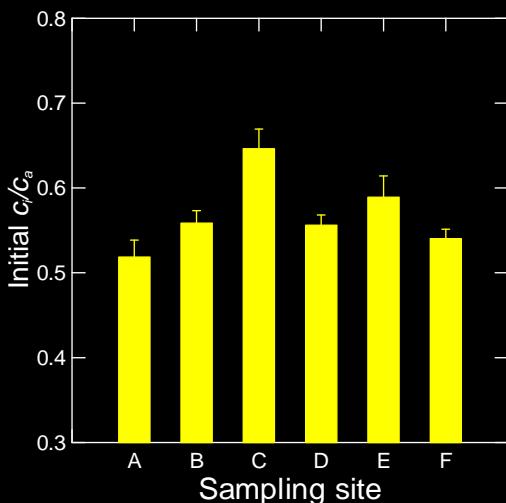

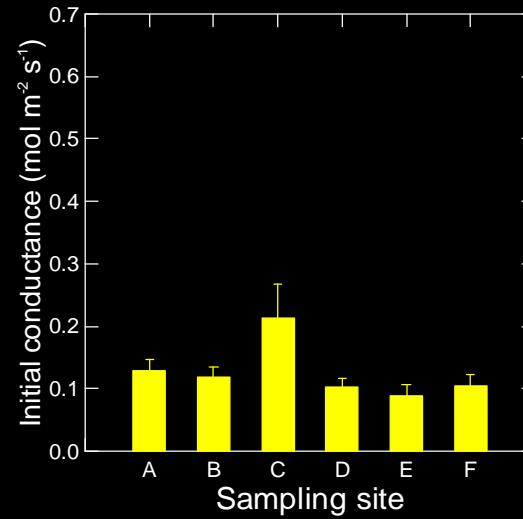

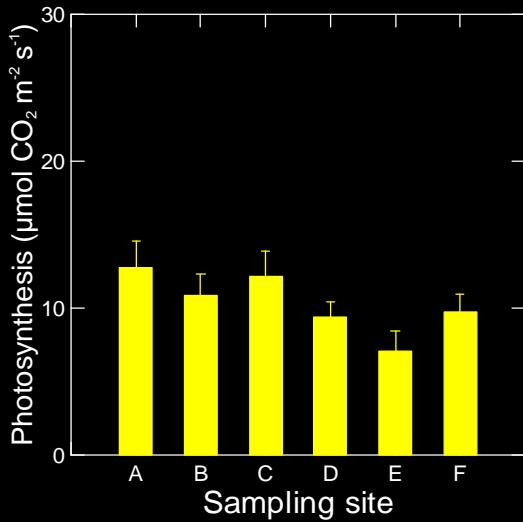

Leaf gas exchange measurements

Leaf gas exchange measurements- Boulia

Leaf gas exchange summary by site

Sampling sites
A- Howard Springs
B- Adelaide River
C- Daly River
D- Dry Creek
E- Sturt Plains
F- Boulia

c_i/c_a relatively constant among sites

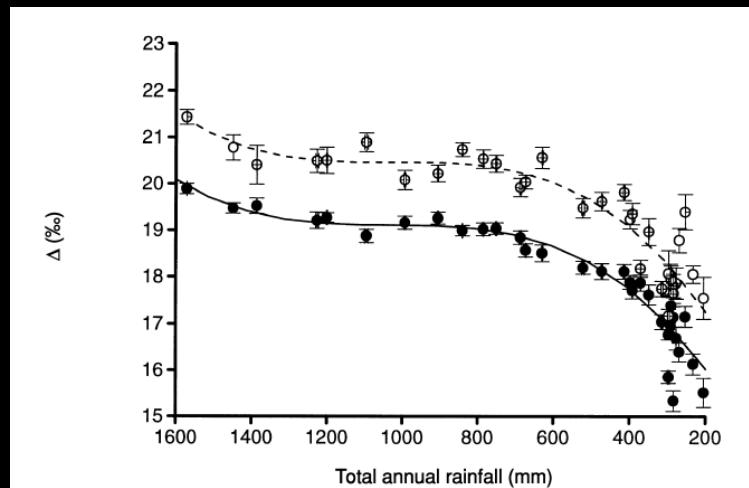

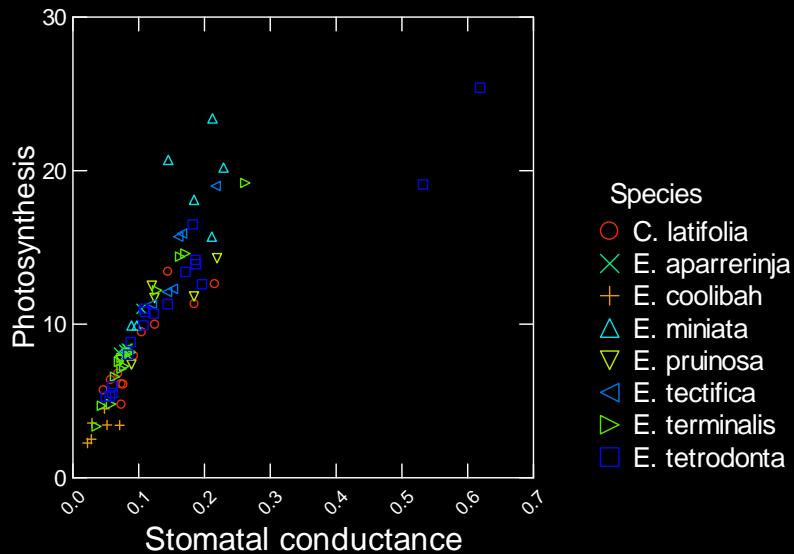

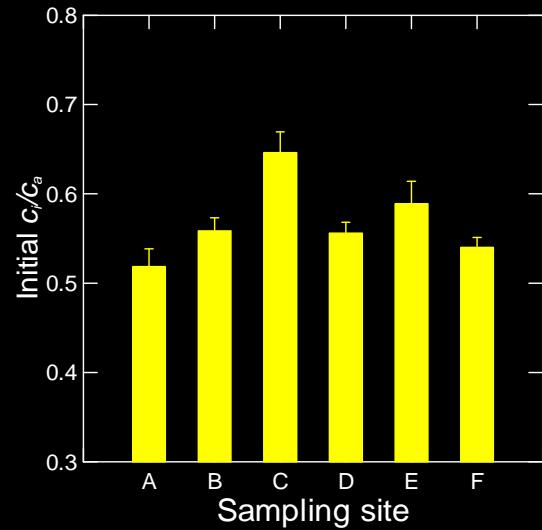

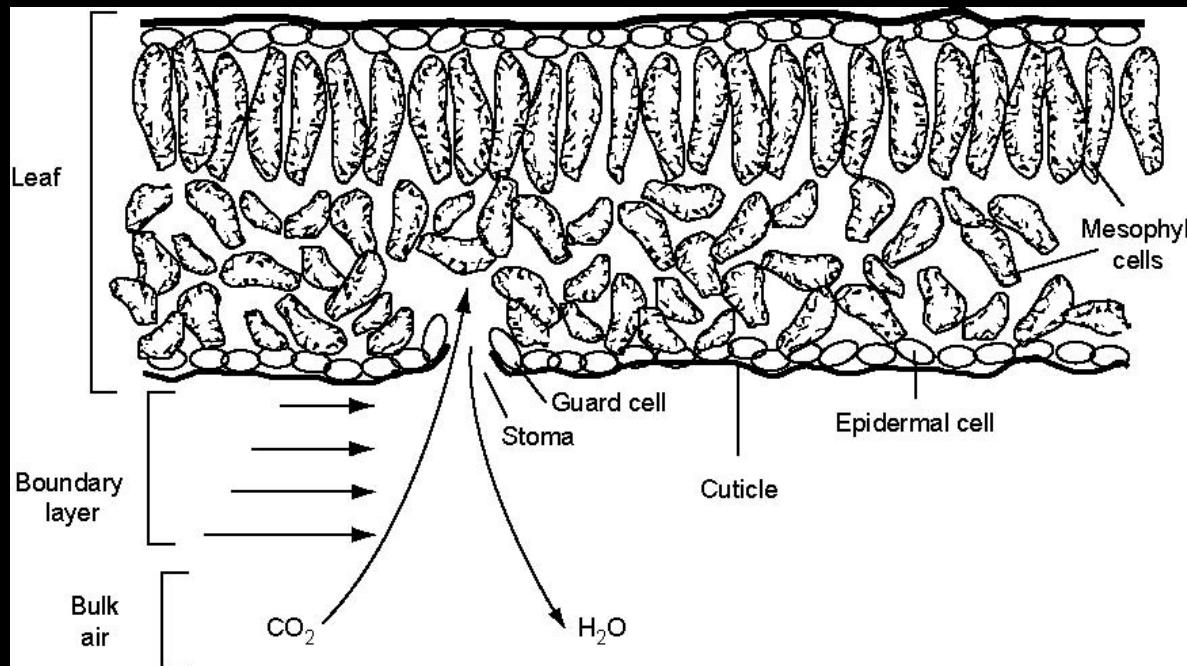

Fig. 5. Response of the zone mean ($\bar{x} \pm \text{SE}$) leaf and wood Δ values to decreasing total annual rainfall. Regression lines from the full set of values ($n = 645$) are: leaf $\Delta = 14.29 + 18.15 \times \text{PPT}_m - 17.74 \times \text{PPT}_m^2 + 5.76 \times \text{PPT}_m^3$ ($r^2 = 0.45$); wood $\Delta = 13.26 + 16.88 \times \text{PPT}_m - 16.28 \times \text{PPT}_m^2 + 5.24 \times \text{PPT}_m^3$ ($r^2 = 0.59$) where rainfall is expressed in m (PPT_m). \circ , Leaf Δ ; \bullet , wood Δ .

Water-use efficiency partly controlled by c_i/c_a

$$\frac{A}{E} = \frac{c_a \left(1 - \frac{c_i}{c_a}\right)}{1.6v}$$

Excel utility for fitting A-C_i curves (Sharkey et al. 2007)

Microsoft Excel - sm001.xls

Please enter your values

T _{leaf}	32 °C
P _{atm}	101 kPa
O ₂	21 kPa

2. Estimate limiting factors (1= rubisco, 2= RuBP regeneration, 3= TPU)
(assign at least one point to limitation 3, enter 0 to exclude points)
3. Press the "Solve" button
4. Adjust limiting factor if needed (use 0 to disregard a data pair)
5. Press the "Save" button to save to your computer and/or
6. Cut and paste outputs if desired

Make no changes here

Eucalyptus tetrodonta temperature response (Daly River)

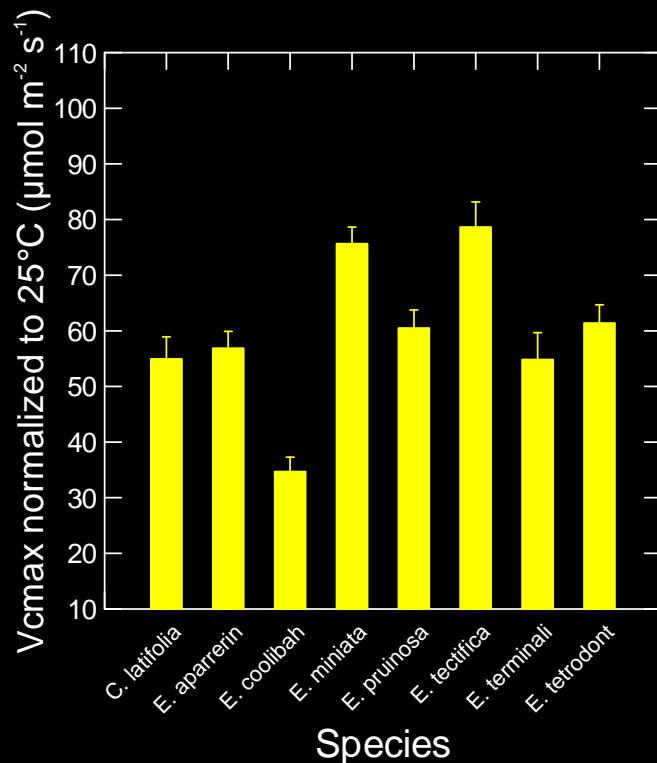

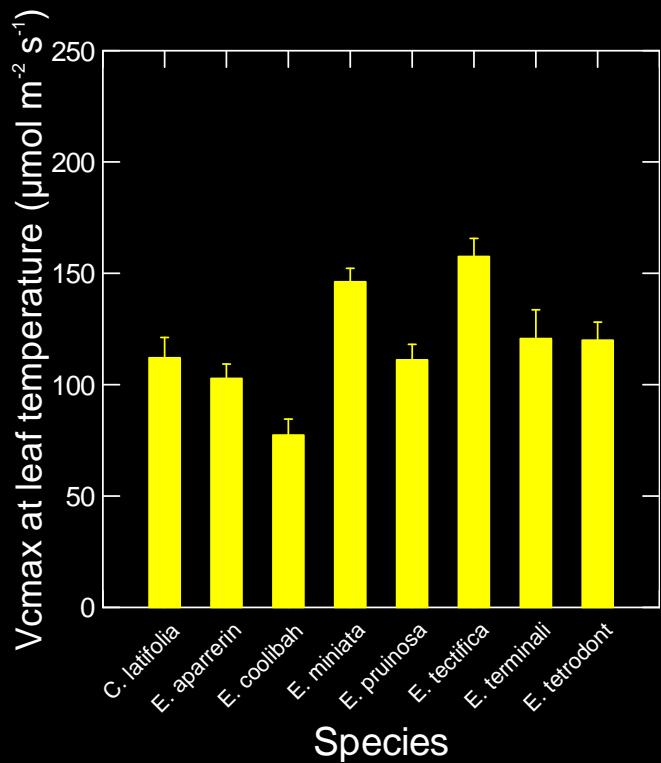

Eucalyptus tetrodonta temperature response (Daly River)

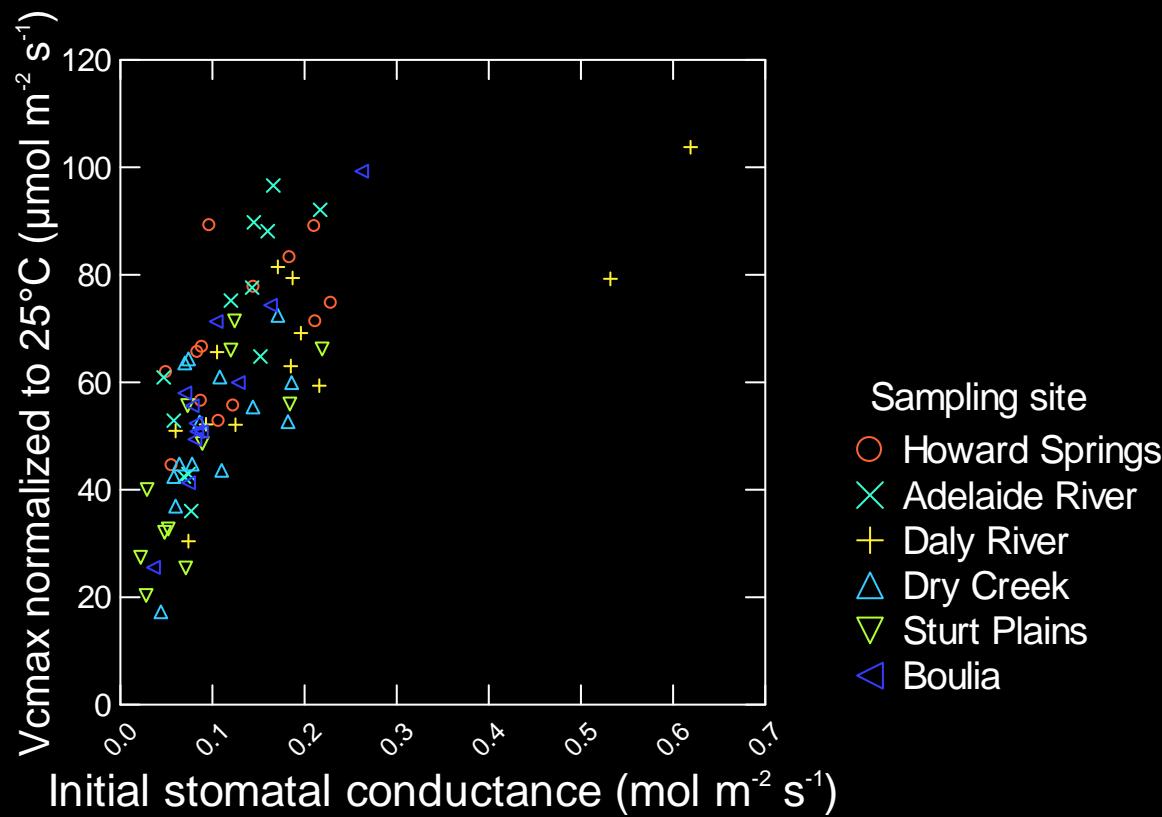

Variation among sites in Vcmax

Variation among species in Vcmax

V_{cmax} showed a strong dependence on initial stomatal conductance

Initial stomatal conductance was the strongest term in ANOVA for Vcmax, but site and species were also significant

Categorical values encountered during processing are:

A/C_c curve

Legend: Aobs (blue dots), Rubisco (red line), RuBP_regen (green line), TPU (yellow line)

Y-axis: A (Photosynthetic rate)

X-axis: C_c, Pa (Carbon dioxide concentration)

Data points estimated from the graph:

C _c , Pa	Aobs (blue dots)	Rubisco (red line)	RuBP_regen (green line)	TPU (yellow line)
0	0	0	0	33
10	5	10	10	33
20	15	25	20	33
30	25	40	30	33
40	30	50	35	33
50	32	58	38	33
60	33	65	40	33
70	33	72	42	33
80	33	78	44	33
90	33	82	46	33
100	33	85	48	33

Conclusions and future directions

- Photosynthesis, conductance and c_i/c_a did not show large variation among sites along the rainfall gradient
- These gas exchange data are consistent with previous measurements of ^{13}C discrimination (Miller et al. 2001)
- V_{cmax} , estimated assuming constant mesophyll conductance of $3 \text{ mol m}^{-2} \text{ s}^{-1} \text{ bar}^{-1}$, showed strong dependence initial stomatal conductance
- Mesophyll conductance and stomatal conductance likely covary
- Leaf samples currently being processed for nitrogen concentration and $\delta^{13}\text{C}$
